

DIRINARIA

John A. Elix

[From *Flora of Australia* volume 57 (2009)]

Dirinaria (Tuck.) Clem., *Gen. Fungi* 84 (1909); from the crustose genus *Dirina* Fr. (Roccellaceae) and the Latin suffix *-arius* (indicating connection), in reference to the superficial resemblance of these genera.

Type: *D. picta* (Sw.) Scher. ex Clem.

Thallus foliose, continuous, lobate, adnate to tightly adnate, 2–12 (–20) cm wide. Lobes irregular to radiating, discrete or confluent, 0.2–3.0 (–5.0) mm wide, eciliate; apices rounded to truncate or flabellate. Upper surface white, grey-white to bluish grey or ochre-yellow, plane to convex or concave towards the periphery, dull or glossy, pruinose or not; soredia, isidia and dactyls present or absent; pseudocyphellae absent; upper cortex paraplectenchymatous, formed by vertically oriented hyphae. Medulla white or pale yellow to scarlet. Lower surface pale brown to brown-black or black, erhzinate, attached by hapters; lower cortex prosoplectenchymatous, formed by longitudinally arranged hyphae. Ascomata apothecial, laminal, orbicular, sessile to subpedicellate; disc black but often whitish to pale grey- or purple-pruinose; thalline exciple prominent or reflexed, well defined and persistent. Epiphyllum pale brown to brown or red, K- or decolorising in K. Hymenium colourless to pale yellow, I+ blue. Hypothecium pale brown to brown or brown-black. Paraphyses septate, simple or with short branches near the apices; apices generally capitate, brown, K-. Ascii of *Lecanora*-type, clavate, unitunicate, 8-spored; apex wall layers thickened, the apex amyloid, with a distinct axial mass. Ascospores brown, 1-septate, thick-walled, mischoblastiomorphic (*Dirinaria*-type), ellipsoidal, 10–24 × (4–) 5–9 (–10) µm. Conidiomata pycnidial, laminal, immersed in elevated warts; conidiophores of type VI (*sensu* Vobis, 1980), pleurogenous. Conidia bacilliform to fusiform.

Dirinaria is mainly a pantropical and subtropical genus with several species extending to temperate or oceanic regions; currently considered to contain c. 36 species world-wide, 13 are known from Australia. These lichens grow on bark, wood, mosses or rocks.

1	Thallus lacking vegetative propagules	2
1:	Thallus with soredia or dactyls	9
2:	Lower surface black (1)	3
2:	Lower surface white to pale brown.....	7
3	Thallus containing sekikaic acid (2).....	9. D. minuta
3:	Thallus containing divaricatic acid	4
4	Apothecial disc purple-pruinose (3:)	11. D. purpurascens
4:	Apothecial disc epruinose or whitish-pruinose	5
5	Hypothecium pale brown to yellow-brown (4:)	3. D. batavica
5:	Hypothecium brown to dark brown	6
6	Hymenium less than 80 µm thick; ascospores 13–18 × 5–8 µm (5:)	13. D. subconfluens
6:	Hymenium more than 80 µm thick; ascospores 16–24 × 7–10 µm	5. D. confluens
7	Thallus loosely adnate; lobes 1–5 mm wide (2:)	4. D. complicata
7:	Thallus tightly adnate; lobes 0.2–1.5 mm wide	8

8	Thallus containing divaricatic acid (7:)	3. <i>D. batavica</i>
8:	Thallus containing sekikaic acid	9. <i>D. minuta</i>
9	Thallus containing sekikaic acid (1:)	10
9:	Thallus containing divaricatic acid	11
10	Dactyls present; orbicular soralia absent (9).....	6. <i>D. consimilis</i>
10:	Dactyls absent; orbicular soralia present	12. <i>D. sekikaica</i>
11	Dactyls present; orbicular soralia absent (9:)	1. <i>D. aegialita</i>
11:	Dactyls absent; orbicular soralia present	12
12	Thallus ochre-yellow; C+ orange; xanthones present (11:)	7. <i>D. flava</i>
12:	Thallus whitish to pale grey; C-; xanthones absent	13
13	Apothecial disc purple-pruinose (12:)	8. <i>D. melanocrina</i>
13:	Apothecial disc epruinose or whitish-pruinose	14
14	Lobes contiguous; apices flabellate; thallus longitudinally plicate and rugose (13:)	2. <i>D. applanata</i>
14:	Lobes slightly disjunct or adjacent; apices not flabellate; thallus not longitudinally plicate or rugose .	10. <i>D. picta</i>
